### EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with LINUS PARK (Reg. No. 45261) on 10/19/07.

The application has been amended as follows:

Claim 1 (Currently Amended) A method of providing access to a wireless communications system in which a plurality of nodes in a first set establish wireless links with wireless units located in geographic proximity to said nodes, said method comprising the steps of:

receiving information characterizing usage level of nodes of a second set, said set node of said second set responsible for frame selection, encryption and handling of access network mobility;

using said information by a node of said first set to determine a first node of said second set with which to connect; and connecting said node of said first set with said first node of said second set;

receiving information by said node of said first set from said nodes of said second set using a multicast address associated with said nodes of said second set;

maintaining a list by said node of said first set of nodes of said second set based on said information; and

Art Unit: 2619

using said list by said node of said first set to determine said first node of said second set with which to connect.

Claim 10 (Cancelled).

Claim 11 (Currently Amended) A radio access system in a wireless communications system comprising:

a plurality of nodes in a first set adapted to establish wireless links with wireless units located in geographic proximity to said nodes;

a connection network coupled to said plurality of nodes of said first set;

a plurality of nodes of a second set coupled to said connection network adapted to provide connections between a node of said plurality of nodes of said first set and said plurality of nodes of said second set, said plurality of nodes of said second set responsible for frame selection, encryption and handling of access network mobility; and processing circuitry adapted to receive information characterizing usage levels of the nodes of the second set and to use said information to determine a node of said second set to connect with said node of said first set;

wherein said processing circuitry being at said node of said first set and being adapted to receive information characterizing usage levels of said nodes of said second set and to use said information by said processing circuitry to determine said node of said second set with which to connect said node of said first set;

Art Unit: 2619

wherein said processing circuitry further adapted to receive information from nodes of said second set using a multicast address associated with said nodes of said second set, to maintain a list of nodes of said second set based on said information, and to use said list to determine said node of said second set with which to connect said node of said first set.

Claim 19 (Cancelled).

Claim 20 (Cancelled).
